

Lab: Create and Use a Custom Resource Definition (CRD)

Goal

Create a `Fruit` CRD that allows you to define fruits like `apple`, `banana`, etc., and deploy a controller that prints them.

Prerequisites

- Kubernetes cluster (e.g. Minikube)
 - `kubectl` installed
 - Optional: `kustomize` and `controller-gen` if building a full controller
-

Lab Structure

```
crd-lab/  
├── crds/  
│   └── fruit-crd.yaml  
├── examples/  
│   └── apple.yaml  
└── controller/  
    └── fruit-controller.sh
```

Define the CRD

 `crds/fruit-crd.yaml`

```

apiVersion: apiextensions.k8s.io/v1
kind: CustomResourceDefinition
metadata:
  name: fruits.example.com
spec:
  group: example.com
  versions:
    - name: v1
      served: true
      storage: true
      schema:
        openAPIV3Schema:
          type: object
          properties:
            spec:
              type: object
              properties:
                color:
                  type: string
                taste:
                  type: string
            subresources:
              status: {}
  scope: Namespaced
  names:
    plural: fruits
    singular: fruit
    kind: Fruit
    shortNames:
      - frt

```

Apply the CRD:

```
kubectl apply -f crds/fruit-crd.yaml
```

Create a Custom Resource (CR)

 examples/apple.yaml

```

apiVersion: example.com/v1
kind: Fruit
metadata:
  name: apple
spec:
  color: red
  taste: sweet

```

Apply the CR:

```
kubectl apply -f examples/apple.yaml
```

Verify:

```
kubectl get fruits  
kubectl get fruit apple -o yaml
```

Create a Simple Controller (optional)

This is a *demo controller* (bash script) that watches the fruit CRs and prints them. In real apps you'd use a proper controller with `client-go` or Kubebuilder.

 `controller/fruit-controller.sh`

```
#!/bin/bash  
  
echo "Watching for Fruit resources..."  
kubectl get fruit --watch -o json | jq -c '.'
```

Run:

```
bash controller/fruit-controller.sh
```

Then try creating more fruits:

```
# examples/banana.yaml  
apiVersion: example.com/v1  
kind: Fruit  
metadata:  
  name: banana  
spec:  
  color: yellow  
  taste: sweet
```

```
kubectl apply -f examples/banana.yaml
```

Clean Up

```
kubectl delete -f examples/  
kubectl delete -f crds/
```

Summary

Component	Description
Fruit CRD	Defines the structure of a fruit
Custom Resources	Concrete fruit instances
Controller	Watches and prints changes
